This fully illustrated guide offers historical context and step-by-step instruction for building and modifying Japanese battleship models. This volume in the ShipCraft series covers the two related classes of Japanese 14in-gunned battleships, originally built during the First World War but subsequently reconstructed. These ships are famous for their towering forward superstructure, usually described as a pagoda bridge, that they featured when rebuilt. The Ise-class ships underwent further reconstruction during the Second World War to emerge as a

unique hybrid of battleship and aircraft carrier to compensate for fleet carriers sunk earlier in the war. This lavishly illustrated guide takes readers through a brief history of the Fuso-class and Ise-class ships, highlighting differences between sisterships and changes in their appearance over their careers. It features color profiles of paint schemes as well as detailed line drawings and scale plans. The modelling section reviews the strengths and weaknesses of available kits, lists commercial accessory sets for super-detailing, and provides hints on modifying and improving the basic kit. This volume also includes a photographic survey of selected high-quality models in a variety of scales and a section on further research references

The Imperial Japanese Navy (IJN) was the third most powerful navy in the world at the start of World War II, and came to dominate the Pacific in the early months of the war. This was a remarkable turnaround for a navy that only began to modernize in 1868, although defeats inflicted on the Russians and Chinese in successive wars at the turn of the century gave a sense of the threat the IJN was to pose. Bringing together for the first time material previously published in Osprey series books, and with the addition of new writing making use of the most recent research, this book details the Japanese ships which fought in the Pacific and examines the principles on which they were designed, how they were armed, when and where they were deployed and how effective they were in battle. A valuable reference source for Pacific War enthusiasts and historians, *The Imperial Japanese Navy in the Pacific War* provides a history of the IJN's deployment and engagements, analysis of the evolution of strategy and tactics, and finally addresses the question of whether it truly was a modern navy, fully prepared for the rigors of combat in the Pacific.

The Imperial Japanese Navy of World War II surpassed the Allied and Axis fleets in innovation and technology. This title covers the 12 Japanese battleships that saw service between 1941 and 1945, including the mighty Yamato. Each class is considered in light of its design and construction, its armament and wartime modifications. The author, Mark Stille, uses primary sources and dramatic photographs to tell the story of these mighty battleships at war, including their major engagements during the raid at Pearl Harbor and the battle of Midway. The first English language book to include photographs from the prestigious Fukui Collection, this investigation will fascinate any naval enthusiast.

This book presents the papers from the latest conference in this successful series on fuel injection systems for internal combustion engines. It is vital for the automotive industry to continue to meet the demands of the modern environmental agenda. In order to excel, manufacturers must research and develop fuel systems that guarantee the best engine performance, ensuring minimal emissions and maximum profit. The papers from this unique conference focus on the latest technology for state-of-the-art system design, characterisation, measurement, and modelling, addressing all technological aspects of diesel and gasoline fuel injection systems. Topics range from fundamental fuel spray theory, component design, to effects on engine performance, fuel economy and emissions. Presents the papers from the IMechE conference on fuel injection systems for internal combustion engines Papers focus on the latest technology for state-of-the-art system design, characterisation, measurement and modelling; addressing all technological aspects of diesel and gasoline fuel injection systems Topics range from fundamental fuel spray theory and component design to effects on engine performance, fuel economy and emissions
