Separation of dietary macromolecules (i.e. proteins, dietary fibers) from micromolecules (i.e. antioxidants, sugars). □ Referred ultrafiltration studies were conducted with membranes between 100 and 1 kDa. □ Polysulphone membranes (20–25 kDa) were very efficient for several separations. □

Electrophoresis in biology uses porous gels as the media. The sample mixture is loaded into a gel, the electric field is applied, and the molecules migrate through the gel matrix. Thus, separation is based on both the molecular sieve effect and on the electrophoretic mobility of the molecules. This method determines the size of biomolecules.
