interest rates during the period of the swap contract. Because an interest rate swap is just a series of cash flows occurring at known future dates, it can be valued by simply summing the present value of each of these cash flows. In order to calculate the present value of each cash flow, it is necessary to first estimate the correct discount factor

Understanding Interest Rate Swap Math & Pricing

An interest rate swap is a contract between two parties to exchange all future interest rate payments forthcoming from a bond or loan. It's between corporations, banks, or investors. Swaps are derivative contracts. The value of the swap is derived from the underlying value of the two streams of interest payments.
